

## MICROSWITCHING

### MICRO-SWITCHING (Door use monitoring)

A micro-switch fitted to the internal mechanism monitors when the MICO unit has been used. This can be linked direct to an alarm system or to activate and control CCTV or other monitoring equipment.

### MICRO-SWITCHING (Bolt status monitoring)

A micro-switch fitted to the internal mechanism monitors the multi-point locking shoots ensuring that they are fully extended when the door is closed. The micro-switch can be linked direct to an alarm system, interlock system, or to activate a CCTV or other monitoring equipment for off site surveillance.

### MICRO-SWITCHING (Electro mechanical/solenoid operation)

Micro-switches fitted to the internal MICO mechanism can be incorporated into solenoid technology. This enables high security multi-point locking to be incorporated within access control or building management systems.
